

Transfusion en chirurgie cardiaque: hétérogénéité des pratiques Comment y remédier?

Philippe Van der Linden MD, PhD

Conflict of Interest Disclosure

In the past 5 years, I have received honoraria or travel support for consulting or lecturing from the following companies:

Fresenius-Kabi GmbH

CSL Behring GmbH

Janssen-Cilag SA

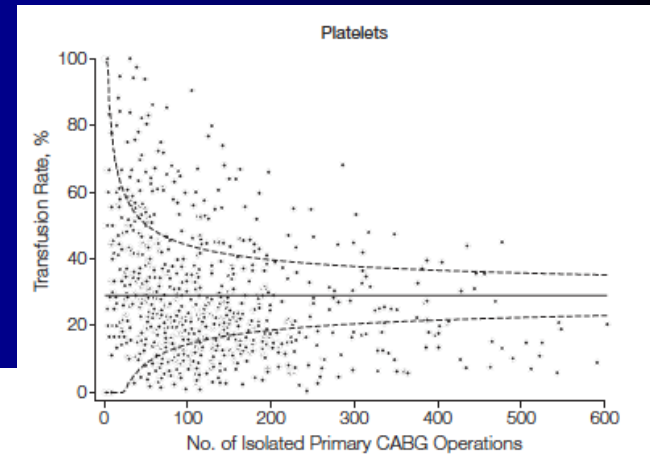

Blood Transfusion in CABG Surgery

- ✓ Observational cohort study of 102,470 patients undergoing primary CABG under cardiopulmonary bypass in 2008 (798 sites < STS Adult Cardiac Surgery Database)

Hospital specific
transfusion rate:
RBC: 8-93%
FFP: 0-98%
Plts: 0-90%

Blood Transfusion in CABG Surgery

- ✓ Observational cohort study of 102,470 CABG patients (year 2008; 798 sites < STS Adult Cardiac Surgery Database)
- ✓ Multivariate analysis after adjustment for patient-level risks factors revealed that hospital transfusion rates varied by geographic location, hospital volume and academic status
- ✓ These 3 hospital characteristics combined explained only 11.1% of the variation in hospital risk-adjusted RBC usage
- ✓ Case mix explained 20.1% of the variation between hospitals in RBC usage

Independent Predictors of Chest Tube Drainage After Transfusion Cardiac Surgery

- ✓ Retrospective observational cohort study of patients undergoing cardiac surgery with CPB (1/2002-2/2008: N=2,575)
- ✓ Independent chest tube drainage predictors identified through multivariate analysis: **individual operating surgeon**, internal mammary artery grafting, CPB time, urgency of surgery, tricuspid valve surgery, redo surgery, LV impairment, male gender, low BMI and higher preop Hb

Independent Predictors of Chest Tube Drainage After Transfusion Cardiac Surgery

- ✓ Retrospective observational cohort study of patients undergoing cardiac surgery with CPB (1/2002-2/2008: N=2,575)

Effects of Perioperative Blood Transfusion and Blood Conservation in Cardiac Surgery Clinical Practice Guidelines upon Clinical Practices

- ✓ Survey of cardiac anesthesiologists and perfusionists' clinical practice to determine the role the STS and SCA Guidelines had in changing these practices.
- ✓ 1402 surveys from 1061 institutions (32% response rate).
- ✓ 78% of anesthesiologists & 67% of perfusionists reporting having read all, part, or a summary of the Guidelines.

Effects of Perioperative Blood Transfusion and Blood Conservation in Cardiac Surgery Clinical Practice Guidelines upon Clinical Practices

- ✓ 20% of respondents reported that an institutional discussion had taken place and 14% that an institutional monitoring group had been formed
- ✓ 26% of respondents reported 1 or more practice changes in response to the Guidelines. The changes made were reported to be highly (9%) or somewhat (31%) effective in reducing overall transfusion rates
- ✓ 4/38 Guideline recommendations were reported by >5% of respondents to have been changed in response to the Guidelines.

RBC Transfusion in Cardiac Surgery: Impact of a Novel Clinical Decision Support Tool

- ✓ Before and after study: implementation of a novel single-view clinical decision support tool within computerized provider order entry coupled with a provider feedback loop

Packed RBC Transfusion Indications

To sign form please click on check mark in top left corner. If fields are grey they do not need to be filled out.

Are you a physician or mid-level provider?

☐ Yes
☐ No

This patient is receiving this blood transfusion due to:

☐ Acute Hemorrhage
☐ Anemia
☐ Anticipated Blood Loss
☐ Other

Anticipated blood loss is an indication that exists solely to prepare for transfusion expecting significant operative/procedural hemorrhage. It is NOT an indication for transfusion.

Other Reason

Acute Hemorrhage

Is there continuous visibly significant blood loss prior to change in vital signs?

☐ Yes
☐ No

Is there hemodynamically significant hemorrhage, as defined below?

☐ Yes
☐ No

This acute blood loss is accompanied by:

☐ A systolic BP < 90 mmHg/min OR
☐ A heart rate of > 110 beats/min, OR
☐ Orthostatic Changes- Increasing HR of at least 30 beats/min
☐ Orthostatic Changes- Reduced systolic blood pressure of at least 20 mmHG

Blood Transfusion Results

04/06/2014 22:42	Hemoglobin	6.8 gm/dL
04/06/2014 22:44	Systolic BP	85 mmHg
04/06/2014 22:44	Heart Rate	110 bpm

Anemia

What is the patient's Hemoglobin?

☐ Hemoglobin [Hgb] < 8gm/dL
☐ Hemoglobin [Hgb] > 8gm/dL, < 10g/dL
☐ Hemoglobin [Hgb] > 10gm/dL

Which of the following is present on patient?

☐ Anemia due to congenital disease
☐ Anemia due to chemotherapy/ablation-related failure of erythropoiesis
☐ Global end organ ischemia, demonstrated by: [lactate] > 3 mmol/L, OR SvO2 or ScvO2 < 60%;
☐ Specific end organ ischemia, demonstrated by: new ST-T wave changes on ECG, OR rising Troponin levels

Reason for transfusion for moderate anemia:

Reason for transfusion for acute hemorrhage:

RBC Transfusion in Cardiac Surgery: Impact of a Novel Clinical Decision Support Tool

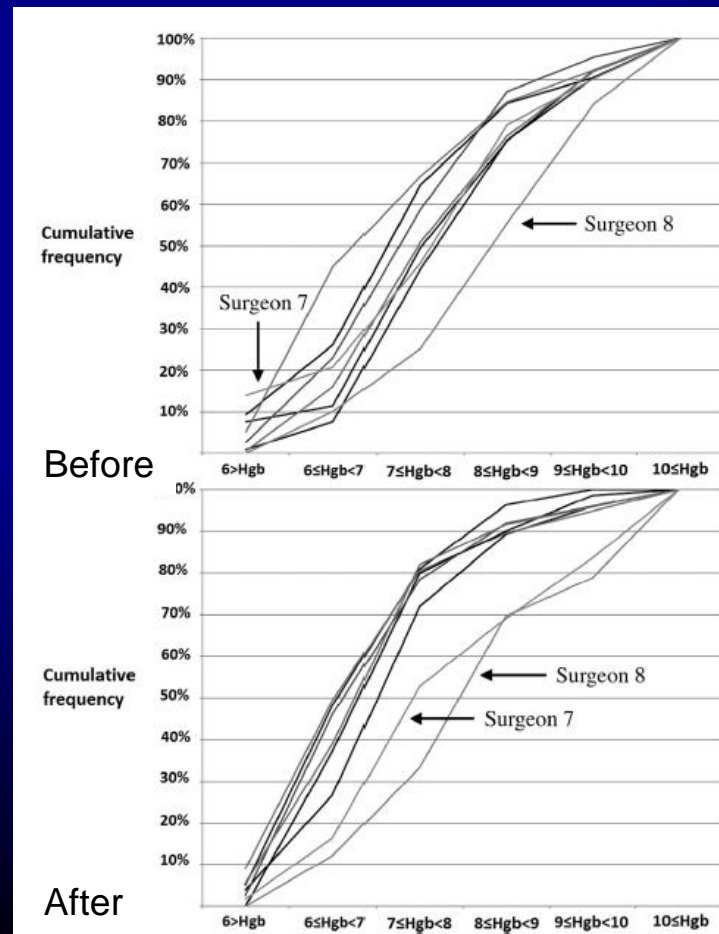

- ✓ Before and after study: implementation of a novel single-view clinical decision support tool within computerized provider order entry coupled with a provider feedback loop

	Pre-intervention N=744	Post-intervention N=765	P value
Postop RBC transfusion (%)	50	41	<0.001
Postop RBC units	1.6 \pm 2.9	1.25 \pm 2.5	0.01
Pre-transfusion Hb level (g/dl)	8.1 \pm 1.5	7.7 \pm 1.4	<0.001

- ✓ No difference in intra-operative transfusions
- ✓ No difference in ICU length of stay and in-hospital mortality

RBC Transfusion in Cardiac Surgery: Impact of a Novel Clinical Decision Support Tool

- ✓ Before and after study: implementation of a novel single-view clinical decision support tool within computerized provider order entry coupled with a provider feedback loop

From Razavi SA et al. J Am Coll Surg 219:1028-36, 2014.

Intraoperative Hemoglobin Management in Cardiac Surgery: Impact on RBC Transfusion

- ✓ Retrospective, before and after study: implementation of measures aiming at reducing hemodilution volume:
 - Decrease in intravenous fluid volume
 - Reduction of CPB circuit size
 - Use of retrograde autologous priming
- ✓ Total IV fluids reduced by 974 ml (672-1276): $p < 0.001$
- ✓ Mean on-pump increase in Hct $> 2\%$

Intraoperative Hemoglobin Management in Cardiac Surgery: Impact on RBC Transfusion

- ✓ Retrospective, before and after study: implementation of measures aiming at reducing hemodilution volume:
 - Decrease in intravenous fluid volume
 - Reduction of CPB circuit size
 - Use of retrograde autologous priming
- ✓ Variability in transfusion rate among anesthesiologists

Comparison of 2 Doses of Tranexamic Acid in Patients Undergoing Cardiac Surgery

- ✓ Multicenter double-blinded randomized study
- ✓ Patients stratified according to transfusion risk
 - Low-dose group: 10 mg/kg + 1 mg/kg.h (N=284)
 - High-dose group: 30 mg/kg + 16 mg/kg.h (N=285)

	Low Dose n = 284	High Dose n = 285	P Value
Transfusion during the first week; all patients			
Blood transfusion (yes)	180 (63.4)	170 (59.6)	0.3†
Packed erythrocyte transfusion (yes)	167 (58.8)	160 (56.1)	0.4†
FFP transfusion (yes)	74 (26.1)	53 (18.6)	0.03†
PC transfusion (yes)	64 (22.5)	43 (15.1)	0.02†
Fibrinogen (yes)	8 (2.8)	1 (0.4)	0.02†

Transfusion Algorithm Based on Point-of-care Coagulation Assays in Cardiac Surgery

- ✓ Retrospective, before and after study: institution of a practical POC-based transfusion algorithm

Transfusion Algorithm Based on Point-of-care Coagulation Assays in Cardiac Surgery

- ✓ Retrospective, before and after study: institution of a practical POC-based transfusion algorithm

		Prealgorithm (N = 1,311)		Postalgorithm (N = 1,170)	P Value
Effectiveness measures					
Erythrocyte transfusions (up to POD-7)	1,311	676 (52%)	1,170	476 (41%)	<0.001
Median number of units (IQR)	676	3 (2–5)	476	2 (1–4)	0.09
Platelet transfusions (up to POD-7)	1,311	448 (34%)	1,170	266 (23%)	<0.001
Median number of units (IQR)	448	5 (5–10)	266	5 (5–10)	0.83
Plasma transfusions (up to POD-7)	1,311	449 (34%)	1,170	167 (14%)	<0.001
Median number of units (IQR)	449	4 (2–6)	167	4 (2–6)	0.35
Cryoprecipitate or fibrinogen concentrate transfusions (up to POD-7)	1,311	53 (4%)	1,170	53 (5%)*	0.5
Prothrombin complex concentrate	1,311	19 (1%)	1,170	13 (1%)	0.5
Large-volume (≥4 units) erythrocyte transfusions (POD-0)	1,311	173 (13%)	1,170	80 (7%)	<0.001
Recombinant factor VIIa (up to POD-1)	1,311	45 (3%)	1,170	14 (1%)	<0.001

- ✓ No difference in outcome measures, except a lower incidence of surgical re-exploration in the postalgorithm group

Transfusion Algorithm Based on Point-of-care Coagulation Assays in Cardiac Surgery

- ✓ Retrospective, before and after study: institution of a practical POC-based transfusion algorithm
- ✓ Results for subgroup analyses were consistent

Incidence & Importance of Anemia in Patients Undergoing Cardiac Surgery in UK

- ✓ National service audit (2010-2012): 12/35 UK cardiac surgery centers provided data
- ✓ 20% of the patients (4754/23,800) did not have preop Hb
- ✓ Incidence of anemia (WHO definition): 31% (23 to 45%):
- ✓ Regional variation remained an independent effect
- ✓ Independent association of anemia with transfusion, mortality, and hospital stay

A 10g/L ↓ in Hb was associated with a 43% ↑ in the risk of transfusion and a 16% ↑ in the risk of death (both $p < 0.001$)

Patient Blood Management

- ✓ Defined as “the appropriate use of blood and blood components with a goal of minimized their use”.
- ✓ Encompasses an evidence-based medical and surgical approach that is multidisciplinary (transfusion medicine specialists, surgeons, anesthesiologists, and critical care specialists) and multiprofessional (physicians, nurses pump technologists and pharmacists)

Patient Blood Management Program

Developing a Blood Conservation Strategy

- ✓ Reliable data base
- ✓ Choice of alternative techniques
 - ▶ Surgical procedure and technique
 - ▶ Patients limitations
 - ▶ Health Care environment
 - ▶ Immediate and long term costs
- ✓ Continuous monitoring
- ✓ Multidisciplinary approach: anesthesiologists, surgeons, blood bankers...

Blood Use in Elective Cardiac Surgery: The 2 Austrian Benchmark Studies

- ✓ Prospective observational multicenter studies
- ✓ April 04–February 05 (N=777) / July 09–August 10 (N=714)
- ✓ Less women, longer surgery and higher use of platelets inhibitors in the 2nd study

	1 st benchmark	2 nd benchmark	P value
Preop anemia (%)	24	treated in 1 % of patients	
Preop Hb (%)	108 ± 12	106 ± 12	0.001
Lowest postop Hb (%)	79 ± 9	76 ± 10	<0.001
POD5 Hb (%)	84 ± 10	81 ± 11	<0.001

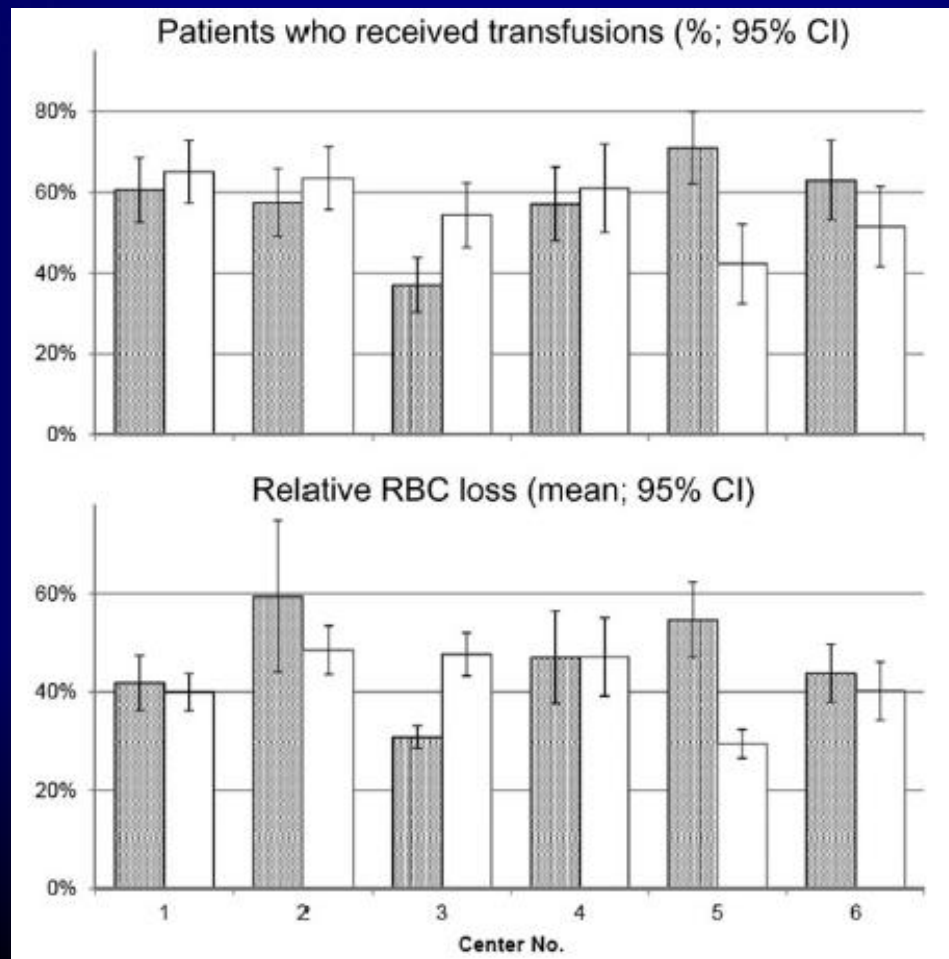

Blood Use in Elective Cardiac Surgery: The 2 Austrian Benchmark Studies

Benchmark: Definition

« Benchmark is a structured continuous collaborative process in which comparisons for selected indicators are used to identify factors that, when implemented will improve transfusion practices »

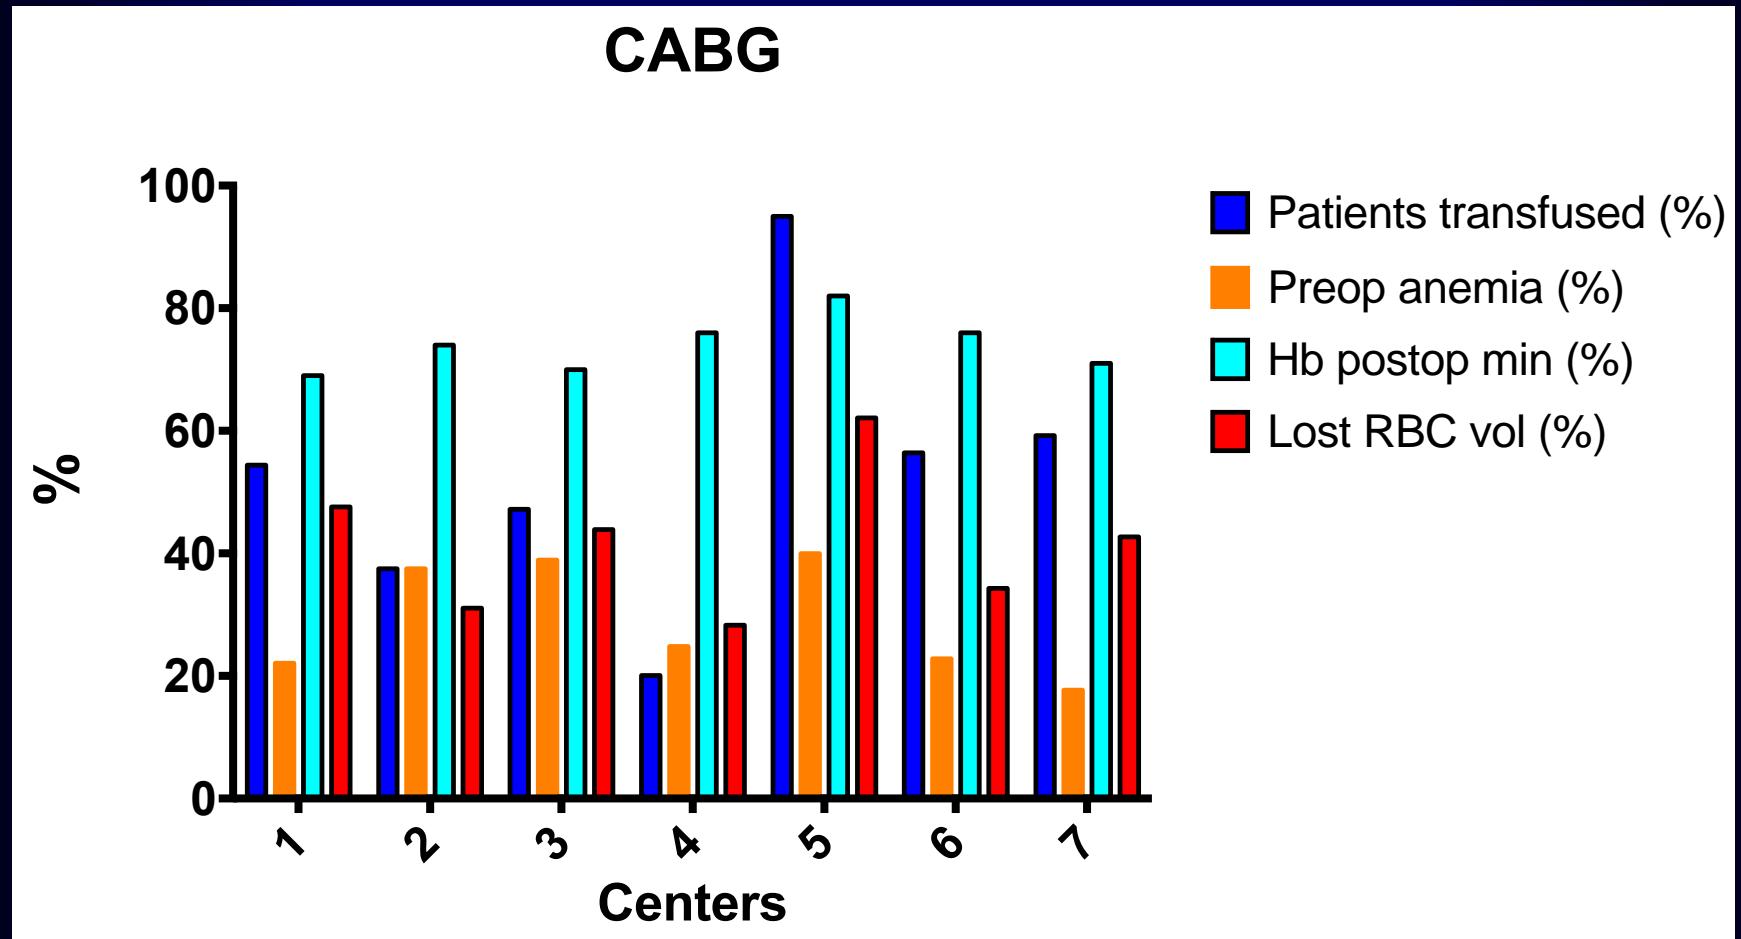

The NATA Benchmark Project

- ✓ Step 1: Evaluation of transfusion practices in different interested centers across Europe and Canada
- ✓ Step 2: Implementation of measures of improvement in these different centers according to their own results
- ✓ Step 3: Re-evaluation of the practices – development of “NATA centers of excellence”
- ✓ Step 4: Enlargement of the project to additional centers under the coordination of these centers of excellence

The NATA Benchmark Project

- ✓ Aim: Providing the basis for educational strategies to implement optimal PBM in participating centers
- ✓ Prospective observational study with online data collection (10 European centers and one Canadian)
- ✓ Incidence of transfusion and volume of RBC transfused significantly different between centers
- ✓ The relative importance of factors explaining RBC transfusion differs across institutions, some being patient related whereas others are related to the healthcare process

The NATA Benchmark Project

Developing a Patient Blood Management Program

- ✓ Reliable database
- ✓ Choice of strategies
 - Surgical procedures and techniques
 - Patients' limitations
 - Health care environment
 - Immediate and long term costs
- ✓ Multidisciplinary approach
- ✓ Continuous monitoring
